

## sheet metal storage system **STOPA TOWER Flex**

The music of sheet metal production machines plays all over the world.

A storage system from southern Germany guarantees availability.

“In the front, you define the tempo.

And in the background,

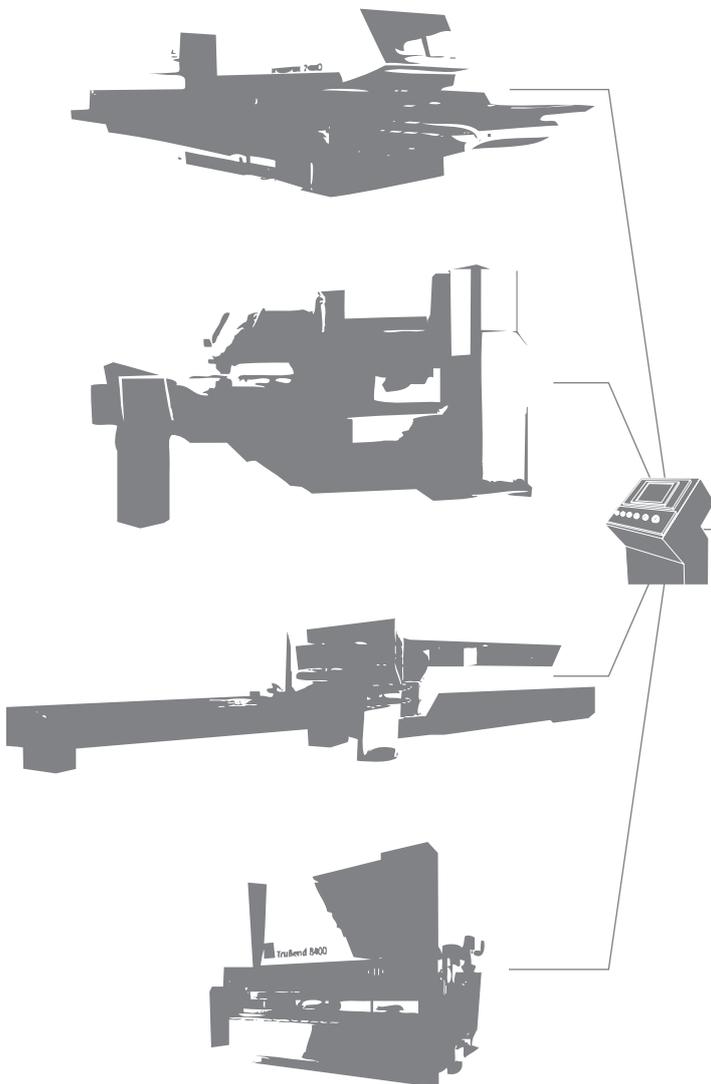

the production machines play the song.”

In a process oriented production line, the focus is on just-in-time delivery of sheet metal in different sizes and thicknesses. Meaning an intelligent storage and retrieval system, that regulates the demand of flat materials fully automatic. And that does not interfere with the overhead material management.

The full automatic storage and retrieval system STOPA TOWER Flex plays in sync with different TRUMPF sheet metal production machines. Not only does it supply an interface for every situation, due to the great variety of options it will also grow with its tasks – and with yours.

That's why the system got the name STOPA TOWER Flex: It changes with your changing needs of your production – today as well as tomorrow.

“And what significance does experience have at

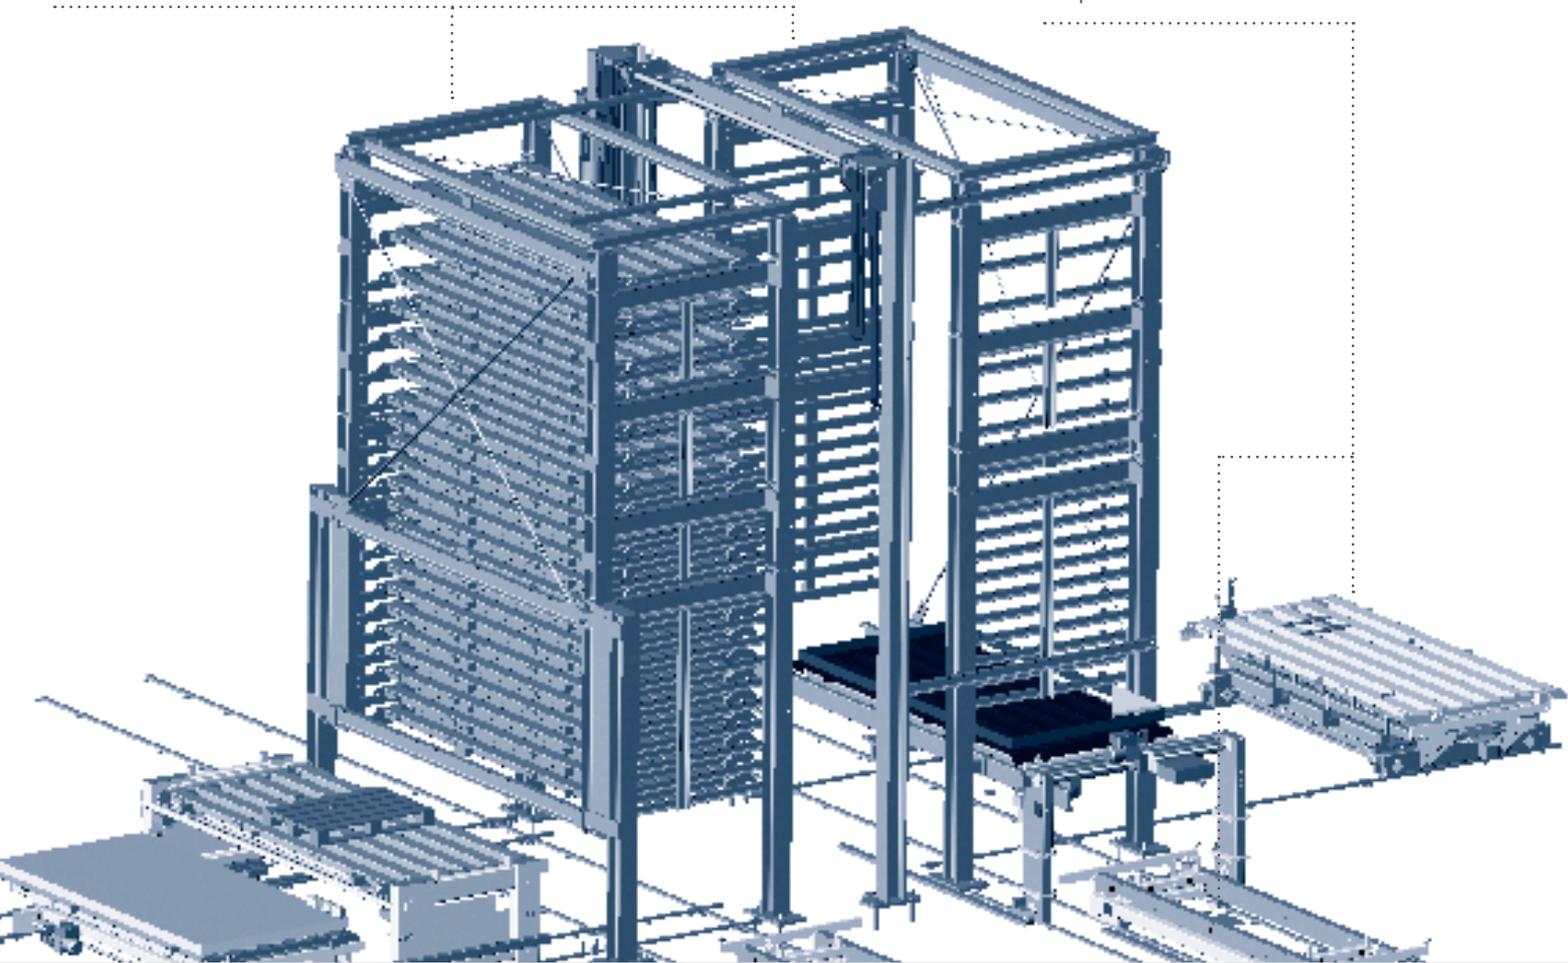

“...more than

**Flexibility of the steel structure:**

According to customer needs, a single tower can be expanded later to a dual tower system. Even two interconnected dual towers standing next to each other are possible. To utilize the maximum available ceiling height, the shelf spacing can be adjusted. Also, as an option the steel structure can hold its own cladding.

**Great variety of stations:**

According to customer needs, transport carts and scissors lifts (also in combination) can enter and exit the steel structure at all openings. Up to 11 stations are possible.

# STOPA?”

1 500 systems worldwide.”

The STOPA TOWER Flex is ideal for flexible storage and retrieval of flat material, even in confined spaces. With its compact design of the steel structure and the systems pallets designed for push and pull technique, an economical system with perfect balance between storage capacity and floor space is created. Initially the system can be installed as dual tower, or as single tower with the option for a later expansion. By using different load- and unload stations, several production machines can be connected to one STOPA TOWER Flex.

- Minimal shelf spacing guaranties maximum storage capacity
- Safe and durable due to a chain hoist with dual strain roller chain
- Low maintenance push and pull conveyor
- Input and output stations for long side or short side available
- Load independant measuring system for exact height positioning
- Pallet position indicator on shelf retrieval unit for precise handling
- Interface to the controllers of your production machines
- In time storage overview with connection to a storrage managing software

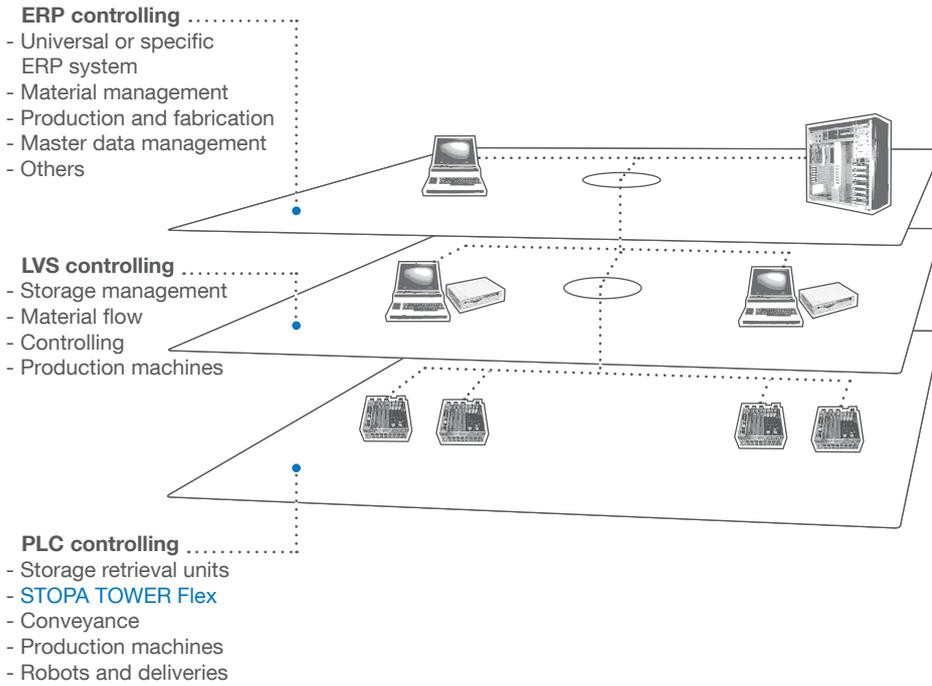

Picture of a dual tower version – initially also as single tower available.

# “Where is the controller?”

“...on the left.”

Since the STOPA TOWER Flex can interface to virtually all sheet metal production machines, and because of the integration into different ERP systems, the storage management system needs to be compatible, but also open to possible changes.

With the LVS Basic, a storage automation module, STOPA offers an innovative link between storage management and production machines to its customers and partners.

The LVS Extended is able to manage data of the production machines as well as the flat materials and parts lists. According to customer orders and production parts lists, the software module delivers raw material to the connected production machines for lights-out operation.

## Controller compatible with LVS system:

The PLC is independent and can communicate with different LVS systems. Automatic operation is possible even without the LVS. That's why all diagnostic functions are kept on the PLC level.

## Experience with reliable interface:

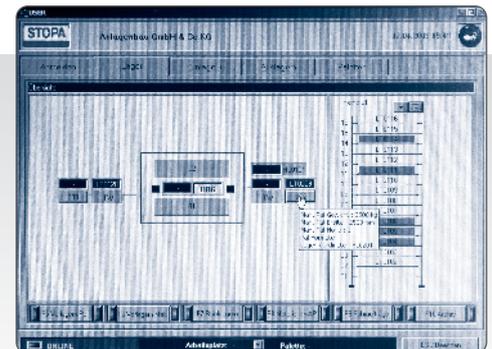

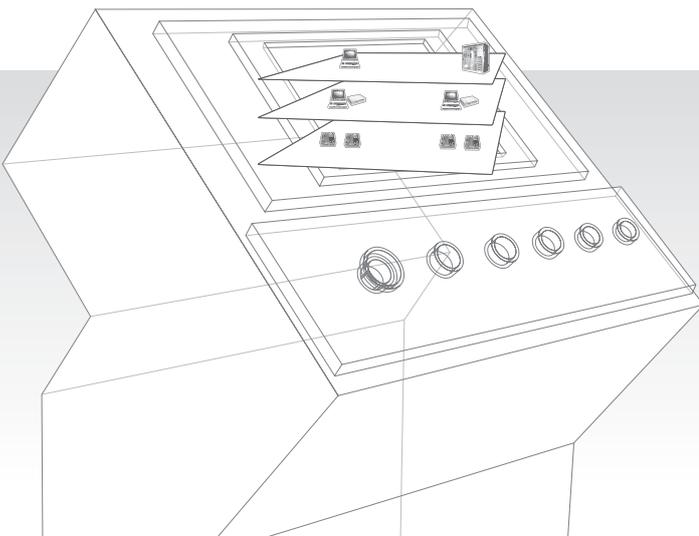

LVS-Basic or -Extended (STOPA)

TC-Cell or CELL-Server (TRUMPF SYSTEMS)

DATA LEAP / COLUMBUS (ESAB CUTTING SYSTEMS)

Customer specific LVS, in case already existing

All controls are equipped with a modem and telediagnostic software. Stopa service can log in any time to troubleshoot and fix problems.

The 12" TFT Display continuously shows the system status, as well as a graphic visualization of the steel structure, storage retrieval unit and stations.

# The options are on the right.”

You can choose between several tower varieties and different heights, and optionally also among different add-ons in the first and following stages. Experienced specialists will guide you through the planning stages and can show possibilities for expansion early. Because in the automated production business the saying: “You never know what tomorrow will bring...” is true today more than ever.
